KNOW-HOW

The correct installation of Armaflex on bends
STAY AHEAD OF THE CURVE WITH ARMAFLEX

No other insulation material can be installed as easily and neatly as the highly flexible Armaflex products. The elastomeric insulation tubes can simply be sleeved over new pipes. When insulating existing pipework, the tubes are slit and laid around the pipes, then the seam is glued with Armaflex adhesive.

On elbows, too, the Armaflex tubes can usually simply be sleeved over the pipes. However, on tighter bends there is a risk of the insulation kinking in the throat of the bend, resulting in a reduction of the insulation thickness here. In cold applications this compression can lead to condensation on the surface of the insulation material. If there is a risk of the insulation material kinking and the glued seam being compressed, segment bends must be fabricated.
INSULATING BENDS: THE APPLICATION TECHNIQUES

1. SLEEVING OVER ARMAFLEX TUBES

Pipes can be insulated simply by sleeving over Armaflex tubes. This application technique can also be used on bends. The tubes must be clean and dry and should slide smoothly back and forth when they are sleeved over.

“Push, don’t pull! If you try to pull the Armaflex tube along the pipe, the insulation may tear. Instead you should always push the tube over the pipe.”

2. FABRICATING SEGMENT BENDS

If there is a risk of the insulation material kinking in the throat of the bend it is imperative that fitting covers are fabricated. Kinking of the insulation material in the throat of bends results in a reduction of the insulation thickness in this area.

In air-conditioning and refrigeration applications condensation can occur on the surface of the insulation. If tubes with a self-adhesive seal are installed, there is the additional risk of the adhesive being compressed in the area of the bend and the seam then coming apart.

“Always insulate bends with standard tubes! Don’t use self-adhesive tubes for this purpose!”

Segment bend with one middle part

Bends made of Armaflex are usually fabricated as segment bends with one middle part. Two or three middle parts are only necessary for very large, obtuse bends.

Note: The yellow lines indicate where cuts are to be made. For exact angles please use the Armaflex template.

Instructions for fabricating other bends out of tube and sheet material can be found in the Armaflex Application Manual.

The fabrication of segment bends is demonstrated very clearly in an Armaflex application video. All Armacell videos can be found at armacell.de and on our YouTube Channel.
GENERAL ADVICE ON THE INSTALLATION OF ARMAFLEX

Using the Armaflex template
When fabricating fitting covers, the pieces of tube need to be cut at various angles depending on the circumference, diameter and radius. To help installers, an Armaflex template is printed on each Armaflex box.

1. Place the Armaflex template with the printed side up on a table or workbench.
2. Align an Armaflex tube across the template parallel to the horizontal base line.
3. Select the required angle from the template and cut along this line.
4. Press the surfaces together carefully and with sufficient pressure, working from the inside to the outside.
5. Do not use the wet-bonding technique when gluing butt joints “under compression”.
6. Secure the ends of the tubes to the pipe surface by applying adhesive to the entire circumference in a width at least equal to the insulation thickness.

The correct gluing technique
1. Apply Armaflex adhesive in a thin, even coat to the two surfaces to be bonded.
2. Allow the adhesive to tack dry! The minimum tack-drying time depends on the ambient conditions.
3. Contact adhesives develop their maximum adhesive force when they are still slightly tacky when tested with a fingernail, but they must not be stringy!
4. Press the surfaces together carefully and with sufficient pressure, working from the inside to the outside.
5. Do not use the wet-bonding technique when gluing butt joints “under compression”.
6. Secure the ends of the tubes to the pipe surface by applying adhesive to the entire circumference in a width at least equal to the insulation thickness.

Note: Always use Armaflex adhesive and cleaner. Never glue seams under tension, always under compression.
